Debit day, salary timing and avoidable failure - 2024 control review

Morning,

I need help with something that sounds simple but probably is not.

Payments wants to test whether collection timing, rather than inability to pay, explains repeat debit-order failure. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

The questions I would ask in the room are:

1. What would we expect to see if retry timing improves success?
2. What evidence would instead support that fixed collection rules work differently across customer groups?
3. How do we rule out that collection before regular inflow drives failure?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2024 as the new evidence point rather than recycling the earlier conclusion. Please work towards whether to test alternative debit dates or change retry logic. A useful output would be a working Excel file with the exception population and clear columns.

Use debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments. One caution: Regular inflows are inferred from transaction patterns; no verified payroll calendar is available.

Regards
