Which technical failures actually harmed customers? - 2024 control review

Morning,

I need help with something that sounds simple but probably is not.

Infrastructure can see technical symptoms, but incident severity should reflect failed customer journeys and repeat attempts rather than machine alerts alone. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

The questions I would ask in the room are:

1. What would we expect to see if a small terminal or channel group creates most harm?
2. What evidence would instead support that latency rises before visible failure?
3. How do we rule out that customers retry across channels and create duplicates?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2024 as the new evidence point rather than recycling the earlier conclusion. Please work towards incident priority, root-cause ownership and the customer-remediation population. A useful output would be a short decision pack with no more than five slides and an attached evidence table.

Use transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. One caution: The dataset has channel and ATM telemetry, not complete application, server or network logs.

Regards
