Which failures are really sitting with a third party? - 2024 control review

Team,

Before this becomes another standing report, can we answer the real question?

Third-Party Risk wants to understand whether external dependencies are repeatedly associated with failed or delayed customer journeys. The possible stories are that repeat incidents create disproportionate customer contact, that internal latency is being attributed externally, or that third-party timeouts cluster by channel.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2024 as the new evidence point rather than recycling the earlier conclusion. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Please prepare a control view with the exceptions, owner and reason each item was included. The output must help us decide which supplier relationship requires evidence gathering or a formal service review.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions.

Please state the limitation plainly: There is no vendor master, contract, SLA or invoice table. Treat external-context fields as indicators, not contractual proof.

Thanks
