Customer funds, bank timeout or downstream rejection? - 2024 control review

Team,

Before this becomes another standing report, can we answer the real question?

Operations is grouping all failed payments together even though the next action depends on the actual cause. The possible stories are that insufficient funds explains the event, that mandate status or retry sequencing explains the event, or that third-party or bank timeout explains the event.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2024 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Please prepare a control view with the exceptions, owner and reason each item was included. The output must help us decide the operational owner, customer message and monitoring rule for each failure family.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions.

Please state the limitation plainly: Do not infer a technical component failure beyond the error and timing fields available.

Thanks
