Collections capacity is being spent on customers who self-cure - 2024 control review

Team,

Before this becomes another standing report, can we answer the real question?

Collections wants to reduce unnecessary contact by identifying customers who usually restore the account without intervention. The possible stories are that repeat NSF customers need a different treatment, that past contact creates the apparent cure, or that balance recovery and payment timing identify self-cure.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2024 as the new evidence point rather than recycling the earlier conclusion. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Please prepare a one-page finding note plus the underlying CSV for our own review. The output must help us decide which accounts can receive a light-touch reminder and which need an agent.

Data available: collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; debit-order mandates, collection dates, suspensions and cancellations.

Please state the limitation plainly: Observed cure after contact is not proof that the contact caused it.

Thanks
