Which add-ons are actually used? - 2024 control review

Morning,

I need help with something that sounds simple but probably is not.

Product bundles are recorded at account level, but Pricing needs to know whether customers use optional features and remain active. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

The questions I would ask in the room are:

1. What would we expect to see if default products are mistaken for cross-sell?
2. What evidence would instead support that some bundles increase service contact without increasing use?
3. How do we rule out that optional products deepen activity?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2024 as the new evidence point rather than recycling the earlier conclusion. Please work towards which bundle components should be retained, repriced or removed from campaigns. A useful output would be a model-ready table, data dictionary and an honest baseline.

Use monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; campaign design and customer responses. One caution: Product enrolment is not the same as product usage; define observable use before measuring adoption.

Regards
