Late posting, retries and unusual behaviour are being mixed - 2024 control review

Team,

Before this becomes another standing report, can we answer the real question?

Investigators report that some suspicious patterns disappear once transaction timing, retries and customer contacts are reconstructed. The possible stories are that bank-side delay creates impossible sequences, that repeated attempts inflate velocity, or that a known service interaction explains the change.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2024 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Please prepare a short decision pack with no more than five slides and an attached evidence table. The output must help us decide which alert features should be corrected, retained or routed elsewhere.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions; monthly account snapshots, status events, limits, product enrolments and signatories.

Please state the limitation plainly: A plausible explanation is not automatic clearance; investigators still own the decision.

Thanks
