Ageing operational exceptions by customer harm - 2024 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Operations needs an ageing view that prioritises unresolved customer impact rather than raw exception count. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that small-value cases remain open because ownership is unclear? Or are we actually seeing that older cases cluster in one process? I also do not want us to miss the possibility that status updates close records without resolving the transaction.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the exception priority rule and escalation threshold. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; monthly account snapshots, status events, limits, product enrolments and signatories. Use observable dates and outcomes; do not infer internal queue age where no queue record exists.

Regards
