Which branch visits are fixing another process? - 2024 control review

Morning,

I need help with something that sounds simple but probably is not.

Regional managers suspect that statement requests, card problems and failed digital journeys are creating avoidable branch demand. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

The questions I would ask in the room are:

1. What would we expect to see if customers prefer branch for complex needs?
2. What evidence would instead support that specific communications fail to explain the next step?
3. How do we rule out that service failures drive repeat visits?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2024 as the new evidence point rather than recycling the earlier conclusion. Please work towards which demand should be removed, redirected or staffed differently. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. One caution: There is no branch queue-time or staff-roster table; infer demand drivers, not staffing productivity.

Regards
