Card blocks need a customer-harm view - 2024 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Card blocking protects customers, but repeated legitimate attempts and later complaints may reveal controls that are too blunt. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that ordinary PIN errors create avoidable blocks? Or are we actually seeing that customers receive inconsistent recovery paths? I also do not want us to miss the possibility that blocked cards follow genuinely unusual sequences.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is where thresholds, escalation or customer communication should change. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. Do not label a block as incorrect without the rule decision and investigation outcome.

Regards
