The metric is stable only because the definition keeps moving - 2024 control review

Team,

Before this becomes another standing report, can we answer the real question?

Analytics is receiving requests that use the same business term for different populations, dates and customer relationships. The possible stories are that the teams need different metrics, that snapshot timing creates the difference, or that an undocumented exclusion is changing the denominator.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2024 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Please prepare a Power BI page with drill-through to a reproducible case list. The output must help us decide the governed definition, owner, exclusions and reconciliation bridge.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context.

Please state the limitation plainly: A technically consistent definition still needs business ownership and approval.

Thanks
