Follow-up: can we identify the deposit population before the formal return build?

Hi,

This came up in a working session and nobody had the same definition.

Reporting wants to test whether customer type, account type, currency, status and ownership fields can support a future deposit population.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: joint and company accounts need separate treatment; missing ownership or currency fields create the main exceptions; or product classifications are consistent.

There is no confirmed problem yet; this is a request to test an assumption before it becomes policy. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2024 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the data remediation backlog before formal regulatory logic is implemented. Please bring a working Excel file with the exception population and clear columns, including a few cases we can trace from source to conclusion.

The available evidence is monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; account signatory and ownership-role records. No daily balances or official deposit-insurance rules are encoded here; assess data readiness only.

Thank you
