## Historical file does not always mean historical truth - 2024 control review

---

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Repeated monthly parquet snapshots contain fields that may be updated retrospectively, creating risk for trend analysis and models. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Could the answer be that closure or status fields are backfilled? Or are we actually seeing that CDC fragments and snapshots are being combined incorrectly? I also do not want us to miss the possibility that records preserve true as-at state.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which fields need event tables, effective dating or restricted use. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. Do not assume a file path date is the effective date of every field.

Regards
