The PD field needs an outcomes check, not a colour chart - 2024 control review

Hi,

This came up in a working session and nobody had the same definition.

Loan files contain origination PD, LGD and ECL fields, but the bank needs to know whether risk ordering survives into later repayment behaviour.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: higher PD bands show more arrears; missing or defaulted inputs create artificial separation; or product and vintage explain more than the score.

The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2024 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is whether recalibration, segmentation or data remediation is the next step. Please bring a working Excel file with the exception population and clear columns, including a few cases we can trace from source to conclusion.

The available evidence is the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations. The data supports discrimination and outcome analysis, not a complete IFRS 9 validation without default definitions, macro scenarios and accounting policy.

Thank you
