The same symptom can belong to Cyber or Operations - 2024 control review

Hi,

This came up in a working session and nobody had the same definition.

Timeouts, host-response failures and repeated attempts can resemble malicious activity or ordinary service degradation.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: a concentrated account or terminal pattern suggests abuse; operational retries are obscuring the original event; or technical failure explains the cluster.

Please start with the decision we need to make, then show whether the available evidence is strong enough to support it. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2024 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the minimum evidence needed to route an alert to Cyber, Fraud, Payments or Infrastructure. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency. This is triage design from available telemetry, not a substitute for SOC, firewall or application logs.

Thank you
