The recovery sequence needs evidence - 2025 control review

Team,

Before this becomes another standing report, can we answer the real question?

The resilience plan lists systems, but customers experience end-to-end services that cross ATM, card, transaction and communication processes. The possible stories are that recovery restores authorisation before posting catches up, that manual workarounds create later reconciliation breaks, or that cash access degrades before account servicing.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2025 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Please prepare a working Excel file with the exception population and clear columns. The output must help us decide the order in which critical services should be recovered and tested.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions; debit-order mandates, collection dates, suspensions and cancellations.

Please state the limitation plainly: Treat this as a historical service-impact rehearsal, not proof of infrastructure capacity.

Thanks
