Follow-up: deposit reporting readiness from the account data

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Reporting wants to test whether customer type, account type, currency, status and ownership fields can support a future deposit population. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that missing ownership or currency fields create the main exceptions? Or are we actually seeing that product classifications are consistent? I also do not want us to miss the possibility that joint and company accounts need separate treatment.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2025 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the data remediation backlog before formal regulatory logic is implemented. Please send a model-ready table, data dictionary and an honest baseline; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; account signatory and ownership-role records. No daily balances or official deposit-insurance rules are encoded here; assess data readiness only.

Regards
