Decline reason versus customer outcome - 2025 control review

Morning,

I need help with something that sounds simple but probably is not.

The same decline code can lead to a successful retry, an ATM attempt, a phone call or lost activity. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

The questions I would ask in the room are:

1. What would we expect to see if repeat declines cluster by card state or channel?
2. What evidence would instead support that most declines recover immediately?
3. How do we rule out that poor explanations drive complaints more than the decline itself?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2025 as the new evidence point rather than recycling the earlier conclusion. Please work towards which decline reasons need rule, message or service changes. A useful output would be a working Excel file with the exception population and clear columns.

Use transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. One caution: The data does not contain merchant terminal logs or card-scheme dispute outcomes.

Regards
