Please connect the outage to customer outcomes - 2025 control review

Hi,

This came up in a working session and nobody had the same definition.

Infrastructure can see technical symptoms, but incident severity should reflect failed customer journeys and repeat attempts rather than machine alerts alone.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: latency rises before visible failure; a small terminal or channel group creates most harm; or customers retry across channels and create duplicates.

The timing also overlaps with Eskom announces lower stages amid improved plant availability. Treat that as context to test, not an answer. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2025 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is incident priority, root-cause ownership and the customer-remediation population. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. The dataset has channel and ATM telemetry, not complete application, server or network logs.

Thank you
