The correspondent alert needs customer and payment context

Morning,

I need help with something that sounds simple but probably is not.

External alerts identify repeated beneficiary and intermediary-bank patterns that need to be tested against the underlying customers and payment chronology. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

The questions I would ask in the room are:

1. What would we expect to see if settlement delay and suspicious routing are separate issues?
2. What evidence would instead support that legitimate trade activity explains common beneficiaries?
3. How do we rule out that split transfers avoid normal review?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2025 as the new evidence point rather than recycling the earlier conclusion. Please work towards which payments require enhanced review, reporting consideration or closure as explained activity. A useful output would be a one-page finding note plus the underlying CSV for our own review.

Use SWIFT messages, correspondent alerts and nostro breaks; monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context. One caution: Use named customers only inside the restricted working paper; the analytical output must remain an allegation-free triage view.

Regards
