Rapid in-and-out movement needs a proper comparator - 2025 control review

Hi,

This came up in a working session and nobody had the same definition.

Financial Crime wants to test whether rapid receipt and onward movement forms a network pattern or reflects ordinary customer behaviour.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: salary, family support or business cash flow explains the pattern; new accounts act as pass-through accounts; or shared beneficiaries connect otherwise separate customers.

Please start with the decision we need to make, then show whether the available evidence is strong enough to support it. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2025 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which cases deserve investigation and which monitoring rule needs a better peer group. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; debit-order mandates, collection dates, suspensions and cancellations. The output is a triage hypothesis. Do not label a customer a mule without investigation and external evidence.

Thank you
