Two source files tell different stories about the same event - 2025 control review

Hi,

This came up in a working session and nobody had the same definition.

A requested analysis changes depending on whether the team starts from transaction, debit-order, account-status or customer-contact records.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: the sources record different stages of one event; one source is updated retrospectively; or matching logic is joining unrelated records.

There is no confirmed problem yet; this is a request to test an assumption before it becomes policy. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2025 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the source precedence rule and the cases that must remain explicitly unresolved. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. Do not force agreement by dropping exceptions; preserve contradictory evidence for owner review.

Thank you
