Follow-up: the bot contained the conversation, not necessarily the issue

Hi team,

Digital containment is being reported as success even when customers later call, visit a branch or complain.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2025 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Can you test these explanations rather than choosing one at the start?

- certain intents should begin with an agent
- handover occurs too late
- contained contacts resolve the need

The decision is which intents belong in self-service and how success should be measured. Please give us a working Excel file with the exception population and clear columns.

You should be able to build the evidence from customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories. Containment is a proxy; use repeat contact and observable outcomes rather than claiming customer satisfaction.

Thanks
