Which exceptions create the most manual work? - 2025 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Operations wants a proxy for cases repeatedly touched across Payments, Collections, Customer Experience and Finance. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that a small set of exception types creates most hand-offs? Or are we actually seeing that late posting generates downstream work? I also do not want us to miss the possibility that unclear ownership keeps cases open.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2025 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which process should be redesigned and where ownership should sit. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations. There is no work-queue or staff-time table, so report observable hand-offs and repeat events rather than labour hours.

Regards
