Which fields mean as-at, and which mean what we know now? - 2025 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Repeated monthly parquet snapshots contain fields that may be updated retrospectively, creating risk for trend analysis and models. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that records preserve true as-at state? Or are we actually seeing that closure or status fields are backfilled? I also do not want us to miss the possibility that CDC fragments and snapshots are being combined incorrectly.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2025 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which fields need event tables, effective dating or restricted use. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. Do not assume a file path date is the effective date of every field.

Regards
