Did digital adoption remove friction or move it? - 2025 control review

Morning,

I need help with something that sounds simple but probably is not.

Product needs to define successful channel adoption as sustained useful activity rather than enrolment or one event. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

The questions I would ask in the room are:

1. What would we expect to see if customers return to assisted channels after failure?
2. What evidence would instead support that adoption differs by product and customer need?
3. How do we rule out that first successful use predicts continued use?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2025 as the new evidence point rather than recycling the earlier conclusion. Please work towards which onboarding journey and success metric should change. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency. One caution: Available data supports channel behaviour but not every app screen, click or abandoned session.

Regards
