What is driving the non-rand flow? - 2025 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Treasury sees non-rand activity but needs to separate stable customer behaviour from isolated transactions and data artefacts. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Could the answer be that loan participations explain part of the flow? Or are we actually seeing that a small group of customers drives most foreign-currency activity? I also do not want us to miss the possibility that cross-border-enabled accounts are not the same as active cross-border users.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2025 as the new evidence point rather than recycling the earlier conclusion. The practical decision is whether to improve forecasting assumptions or investigate specific flow concentrations. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; loan participation and servicing records available by the request date. This data does not contain market positions, hedges or intraday liquidity; report customer-flow concentration only.

Regards
