Where does cash access fail when customers need it most? - 2025 control review

Morning,

I need help with something that sounds simple but probably is not.

ATM failures and blocked-card issues can shift customers toward branches, especially during infrastructure disruption. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

The questions I would ask in the room are:

1. What would we expect to see if customers switch to smaller withdrawals or branch contact?
2. What evidence would instead support that specific provinces show repeat access failure?
3. How do we rule out that cash-bin or host issues dominate?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2025 as the new evidence point rather than recycling the earlier conclusion. Please work towards where contingency communication and ATM support should be prioritised. A useful output would be a one-page finding note plus the underlying CSV for our own review.

Use ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; monthly customer and KYC snapshots. One caution: The data does not contain branch cash holdings or queue time.

Regards
