The incident clock and the customer clock are not the same - 2025 control review

Hi,

This came up in a working session and nobody had the same definition.

Infrastructure can see technical symptoms, but incident severity should reflect failed customer journeys and repeat attempts rather than machine alerts alone.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: customers retry across channels and create duplicates; latency rises before visible failure; or a small terminal or channel group creates most harm.

There is no confirmed problem yet; this is a request to test an assumption before it becomes policy. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2025 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is incident priority, root-cause ownership and the customer-remediation population. Please bring a one-page finding note plus the underlying CSV for our own review, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. The dataset has channel and ATM telemetry, not complete application, server or network logs.

Thank you
