Where does self-service hand the customer a new problem? - 2025 control review

Hi,

This came up in a working session and nobody had the same definition.

Digital containment is being reported as success even when customers later call, visit a branch or complain.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: handover occurs too late; contained contacts resolve the need; or certain intents should begin with an agent.

The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2025 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which intents belong in self-service and how success should be measured. Please bring a short decision pack with no more than five slides and an attached evidence table, including a few cases we can trace from source to conclusion.

The available evidence is customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories. Containment is a proxy; use repeat contact and observable outcomes rather than claiming customer satisfaction.

Thank you
