Why do newly opened accounts go quiet? - 2025 control review

Team,

Before this becomes another standing report, can we answer the real question?

Product wants to understand why some customers make an initial deposit but fail to establish recurring activity. The possible stories are that the account was opened for a one-off purpose, that activation friction causes early dormancy, or that fees or a failed first journey discourage use.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2025 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Please prepare a model-ready table, data dictionary and an honest baseline. The output must help us decide which onboarding intervention or product proposition should be tested.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; available initial-deposit records up to the request date; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions.

Please state the limitation plainly: The data cannot observe the customer's relationship with competing banks.

Thanks
