KB 201912 bank statement matching issue

Morning Thabo,

Finance is trying to compare the customer bank statements to what we have in the transaction files, but there are too many small differences to check by hand.

Some are normal things like bank charges, interest, tax and fees. Others look like timing delays where one system posted later than the other. I do not want those mixed together.

Can your team create an Excel file I can filter myself that shows what matched, what did not match, what is just a bank fee or interest, and what looks like a real break?

Please keep it understandable for Finance. We do not need technical column names in the front view.

Thanks,
Gugu
